How to Select a Pressure Switch for your Application

## STEP 1 - SERVICE LIFE OF THE SWITCH

Expected service life is the first consideration to be made in selecting a pressure switch, regardless of the pressure or sensitivity desired. If the service life (the number of cycles the switch is expected to operate) is one million or less, use of either a bourdon tube or diaphragm switch is indicated. If a service life of more than one million cycles is desired, a piston switch should be used. An exception to this rule may be made when pressure change in a system is very slight ( $20 \%$ or less, of the adjustable range). Under such conditions a bourdon tube or diaphragm switch can be used up to 2.5 million cycles before metal fatigue.

A second consideration in choosing a pressure switch is the speed of cycling, regardless of the service life. If a switch is expected to cycle more than once every three seconds, a piston type switch should be specified. The metal of any bourdon tube or diaphragm acts as a spring which will heat and fatigue in extremely fast cycling operations, thus shortening the life of the switch.

The media to be controlled must always be considered when selecting a pressure switch and, to simplify selection, wetted materials for each type of switch are noted on applicable catalog pages.

## STEP 2 - PROOF PRESSURES

Choice of the type of pressure switch to be used - diaphragm, bourdon tube or piston - also must be governed by the proof pressure to which it will be subjected. (Proof pressure is the highest surge pressure that will ever be experienced in a system.) It must be remembered that, although a pressure gauge may register a constant operating pressure, there may be surges going through a system that are dampened out by the orifice in the gauge. Diaphragm and bourdon tube pressure switches are extremely sensitive and would be affected by those surges. Barksdale diaphragm switches are available in an adjustable range from vacuum to 150 psi with proof pressures to 300 psi. Barksdale bourdon tube switches are adjustable to 18,000 psi with proof pressures of 24,000 psi. Barksdale piston switches have an adjustable range to 12,000 psi with a proof pressure of 20,000 psi.

## STEP 3 - FUNCTION OF THE SWITCH

The function of the switch is another determining factor in making a selection. Three types of Barksdale pressure switches, based on function, are described below:
(1) Single setting pressure switches sense a single pressure source and open or close a single electrical circuit by means of one snap action electrical switch.
(2) Pressure difference switches sense a change in relationship between two variable contained pressures and open or close a single electrical circuit by means of one snap action electrical switch.
(3) Dual control pressure switches sense two pressure limits from a single pressure source and open or close two independent electrical circuits by means of two snap action electrical switches.

## STEP 4 - TYPES OF HOUSING AVAILABLE

Stripped pressure switches are basic Barksdale pressure switch units without housings. They may be used wherever electrical enclosures are already available and are favored by original equipment manufacturers for use in common cabinets. Naturally, stripped switches may be purchased at a lower cost.

Housed pressure switches are completely enclosed to avoid possible hazard from loose wires in exposed locations.

Terminal block pressure switches are housed and, in addition, are equipped with enclosed terminal blocks, thus eliminating the expense of buying and installing external junction boxes.

Explosion proof pressure switches are designed with heavy housings built to conform to accepted electrical standards in isolating the units from explosive atmosphere. All explosion proof models are equipped with terminal blocks for convenience in wiring.

## STEP 5 - SELECTION OF ADJUSTABLE RANGE

The term "working range" defines the pressure range a switch may see under normal working conditions. This is normally the adjustable range.

For greatest accuracy, the set point should fall in the upper 65\% of the adjustable range. For the most favorable life factor, the set point should be in the lower $65 \%$ of the adjustable range. Therefore, the most favorable combination of accuracy and life factor lies in the middle $30 \%$ of the adjustable range (see diagram). This general rule applies both to diaphragm and bourdon tube pressure switches.

## Supplemental Guide

## General Operating, Engineering \& Service Data

## Steam Service

Only diaphragm and bourdon tube switches are suitable for steam service. Install pressure switch with pressure fitting up; preferably with two or three $4 "$ to $8^{\prime \prime}$ coiling loops in the pressure line to serve as heat exchangers and to form a static water head as buffer to the steam temperature. Dia-Seal type switches may be used if fittings are stainless steel, polysulfone or nickel-plated.

## Chemical Protectors

Many Barksdale pressure switches can be used in conjunction with liquid filled chemical protectors: Contact factory.

1. The DIT, D2T, DIH, D2H, DIX, D2X-H18 or -H18SS switches will have an increase in actuation value (differential) of approximately 50\%.
2. If a capillary system is used, a lag time will be introduced unless the pressure change is very gradual.
3. Only capillary-type connections can be furnished on pressure difference type switches.
4. Piston type switches, models 9048, T9048, C9612, 9672, C9622, TC9622, 9653, 9673 and diaphragm switches with proof pressure ratings of 3 psi and 10 psi ( -2 and -3 models) CANNOT be used with chemical protectors. Econ-O-Trols must have impregnated or polysulfone fittings.
5. Vacuum service greater than $20^{\prime \prime}$ hg. (gauge) is not recommended. For greater vacuum, consult factory with all details of the application given.

## Life Expectancy

The same factors governing the life of gauges and other instruments, using bourdon tube or diaphragm sensing elements, apply to pressure switches.
If with each operating cycle the sensing element must flex over the entire operating range for which it was designed, or whether it flexes only over a small portion of that range considerably affects the life expectancy of the unit.
The second factor to speed up metal fatigue of the tube or diaphragm is the speed with which it must repeat the flexing cycles.
At normal flexing rate (less than 25 cycles per minute) you may therefore find the following variance in the same type of sensing element:
At full range flexing up to $1,000,000$ cycles depending on thickness of diaphragm. The thinner the material, the longer the life. At $50 \%$ of its flexing range up to $3,500,000$ cycles (see above). At 10 to $20 \%$ of its flexing range up to $5,000,000$ cycles (see above).

## Corrosive Environments

Barksdale housed and explosion proof pressure switches intended for use in hostile and/or corrosive environments can be painted with green epoxy paint (color per Federal Standard 595A \#24300). The complete switch is painted after assembly and test at Barksdale. For best results, exposed metal surfaces must be touched up with epoxy paint after installation.

## Typical Wiring Diagrams

## Single Pressure Control

1. Low-Voltage Release

Starter drops out when voltage fails but will pull in when voltage is restored.

Motoraction
(1) Stop at high pressure start when pressure falls by amount of actuation value
(2) Start at low pressure stop when press. pressure value.

## 2. Low-Voltage Protection

Starter drops out when voltage fails but does not start when voltage is restored because relay will open. Manual start switch will close relay again.

Connect pressure switch same as (a) or (b) for desired motor response to Press. change (a) as shown above

## 3. High or Low Level Shut-down Electrical Manual Reset with

Alarm-Low Voltage Protection
Motor started by normally open (manual reset switch) as long as pressure remains within high limit. Motor runs until stop switch is actuated. Low voltage protection is obtained as starter will drop out if voltage fails and will not start again until start switch is closed. When pressure exceeds high limit, pressure switch actuates, motor
 stops, and an alarm is sounded or light lights. (Note: Reverse NO and NC connections to pressure switch for same action on low pressure limit.)

## 4. Hand-Off Automatic Selection

Provides ability to operate starter manually for emergency control.

[^0]
## High/Low Pressure Control

5. Low Voltage Release
(Starter drops out when voltage fails; will pull in when voltage is restored)

## Motoraction

(1) Stop motor at high Press.
(1) Start motor at high Press.
(2) Start motor at low Press.
(2) Stop motor at low Press.

## 6. Low Voltage Protection

Starter drops out when voltage fails but does not start when voltage is restored because relay will open. Manual start switch will close relay again.

Insert relay as shown in line between LI and common connections of pressure switch. Connect as in Diagram 5 for motor action.

## 7. Pressure Condition Indication

To show remotely the Press. condition in system

Condition: Pressure level at or below low; Pressure low; Pressure light on, others off

Condition: Pressure normal, normal; Pressure light on, others off

Condition: Pressure at or above high; Pressure high; Pressure light on, others off

## 8. Achieving Adjustable Differential by relay Control

 (High/Low Level)Solenoid valves-pilot lights-pilot circuits

(a) At high pressure relay is energized Load 1 is de-energized Load 2 is energized (b) At low pressure relay is de-energized Load 1 is energized Load 2 is de-energized

(a) At low pressure relay is energized Load 1 is de-energized Load 2 is energized
(b) At high pressure relay is de-energized Load 1 is energized Load 2 is de-energized

## Conversion Tables

The most frequently needed conversions
are tabulated for low range values. They
area rounded off to the nearest practical
decimal. For more precise conversions,
use the following factors:

| $\mathrm{Kp} / \mathrm{cm} 2 \times 14.22=\mathrm{psi}$ | Inches of Mercury $(\mathrm{In} . / \mathrm{Hg}) \times 13.6=\ln . / \mathrm{H} 20$ |
| :--- | :--- |
| $\mathrm{Kg} / \mathrm{cm} 2 \times 14.22=\mathrm{psi} 14.503=\mathrm{psi}$ | Inches of Water $(\mathrm{In} . / \mathrm{H}, 0) \mathrm{X} .036=\mathrm{psi}$ |
| $\mathrm{Bar} \times 14.503=\mathrm{psi}$ | Feet of Water $(\mathrm{Ft} . / \mathrm{H} 20) \mathrm{X} .433=\mathrm{psi}$ |
| $\mathrm{Kg} / \mathrm{cm} 2 \times \times 14.233=$ psi | Inches of Mercury $(\mathrm{In} . / \mathrm{Hg}) \mathrm{X} .490=\mathrm{psi}$ |
| Inches of Water $(\mathrm{In} . / \mathrm{H} 20) \times 0.07353=\ln . / \mathrm{Hg}$ | Centimeters of Mercury $(\mathrm{Cm} / \mathrm{Hg}) \mathrm{X} .193=\mathrm{psi}$ |
|  | Kilopascals $(\mathrm{KPa}) \times .145=\mathrm{psi}$ |

| in/H2O | psi | in/ Hg | $\mathrm{mm} / \mathrm{Hg}$ | psi | in/Hg | in/H20 | $\mathrm{mm} / \mathrm{Hg}$ | psi | in/Hg | in/H20 | mmHg |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

[^1]- Class GH switches are SPDT with gold contacts.
- Class K switches are SPDT with fine silver contacts and an Elostomer Boot around pin actuators to prevent moisture and foreign matter from affecting contacts. - All other switch classes are SPDT with fine silver contacts and fixed differentials.

- 'Standard' for Regular Housed and Stripped (check with your Barksdale Controls representative
for prices and delivery). All others are 'Special' (check with factory for prices and delivery).

Class GH switches are SPDT with gold contacts.
Class K switches are SPDT with fine silver contacts and an Elastomer Boot around pin actuators to prevent moisture and foreign matter from affecting contacts. - Class R \& S switches are SPDT with fine silver contacts and adjustable differentials. All other switch classes are SPDT with fine silver contacts and fixed differentials. Class A, H, \& M switches meet humidity requirements of MIL-S-6743.

**L/R = .026. $L / R$ is the ratio of inductance to resistance. It is the time required for the current to rise to $63 \%$ of the maximum value.
${ }^{* * *} 6,12$ and 24 VDC electrical ratings are for engineering reference only. These ratings are not recognized by the UL and CSA. Standard nameplate marking does not include these ratings.

- Class GH switches are SPDT with gold contacts.
- Class R \& S switches are SPDT with fine silver contacts and adjustable differentials.
- All other switch classes are SPDT with fine silver contacts and fixed differentials.
- Class A, H \& M switches meet humidity requirements of MIL-S-6743.

How to Select Adjustable Differential from Charts

## Econ-O-Trol Models

1. Establish Set Point required.
2. Establish Adjustable Differential required.
3. Select chart within maximum adjustable range.
4. Project Set Point vertically until it crosses horizontal projection of desired Adjustable Differential. To obtain the desired differential, lines must cross between heavy horizontal lines labeled "Minimum" and/ or "Maximum."
5. For comparison, the heavy horizontal line labeled "Standard" shows how differential varies from lowest to highest setting on fixed differential models.

## Barksdale Diaphragm and Bourdon Tube Pressure Switches

| Suspected Pressure Switch Trouble | Check | Possible Causes | Remedy |
| :---: | :---: | :---: | :---: |
| A. Will not actuate at desired pressure. | 1. Check catalog for range of switch. <br> 2. Disconnect switch electrically. <br> 3. Apply pressure to switch and check actuation point with accurate gauge. <br> 4. Maximum surge pressure in system. <br> 5. Maximum current and voltage through switch with ammeter and voltmeter. | 1. Desired setting out of switch range. <br> 2. Switch not set at proper pressure. <br> 3. Pressure gauge defective. <br> 4. Defective switch element. <br> 5. Over stressed or fatigued pressure sensing element. <br> 6. Loose adjusting screw or bracket. <br> 7. Surplus electrical leads interfering with switch action. <br> 8. Current or voltage beyond switch capacity. <br> 9. Surge pressures in system exceed proof pressure of switch. | 1. Replace pressure capsule or bourdon tube with proper range. <br> 2. Readjust switch. <br> 3. Replace pressure gauge. <br> 4. Replace switch element. <br> 5. Replace pressure capsule (check cycling rate for possible piston switch application). <br> 6. Replace or tighten. <br> 7. Remove surplus from area around switch element. <br> 8. Install relay or switch <br> element with higher rating. <br> 9. Replace pressure capsule, bourdon tube or switch with proper proof pressure. |
| B. Will not reactuate at desired pressure. | 1. Check catalog for actuation value range. <br> 2. Check 2, 4 and 5 under $A$ above. <br> 3. Apply pressure to switch and check actuation value with accurate gauge. | 1. Specification does not match switch. <br> 2. See 3 thru 9 Trouble A. | 1. Change specification or get proper pressure switch. <br> 2. See 3 thru 9 Trouble A |
| C. Rapidly actuates and reactuates or chatters or unwanted actuations. | 1. Check for instantaneous rapid pressure fluctuation in system. <br> 2. Mechanical vibration of switch. | 1. Peaks and valleys of surges are in excess of actuation value of switch. <br> 2. Vibration causes unwanted actuation when switch is near set point. | 1. (a) Put surge damper on switch. <br> (b) Replace with pressure switch of larger actuation value <br> 2. Change position of switch or shock mount. |
| D. Actuation point changes with temperature. | 1. Check maximum and minimum temperatures. <br> 2. Check for loose adjustment screw or bracket. | 1. Temperature changes drastic <br> (i.e. over plus or minus $50^{\circ} \mathrm{F}$ ). | 1. (a) Readjust for changes. <br> (b) Set switch at highest possible temperature to minimize effect of changes. <br> 2. Tighten or replace screws. |
| E. Actuation point of switch changes over period of time. | 1. Maximum current through switch. <br> 2. Number of pressure cycles on switch. <br> 3. Moisture in switch. | 1. Overloading of switch contacts. <br> 2. Service life of switch exceeded (consult data). <br> 3. Corrosion of parts. | 1. Replace with pressure switch with higher current rating. <br> 2. Replace pressure switch. <br> 3. Seal conduit. |
| F. Cannot get current through switch when actuates or reactuates. | 1. Check for power at switch. <br> 2. Check maximum current through switch. <br> 3. Poor electrical connections. <br> 4. Desired electrical circuit. | 1. Line not "hot." <br> 2. Corroded or loose connections. <br> 3. Connected to wrong leads on switch. <br> 4. Contacts fused. | 1. Get power to switch. <br> 2. Make new or tight connection. <br> 3. Make proper connection (consult wiring diagram or color code). <br> 4. Replace pressure switch. |

Supplemental Guide

## Trouble-Shooting Pointers

Barksdale Econ-O-Trol \& HI-P Pressure Switches

| Suspected Pressure Switch Trouble | Check | Possible Causes | Remedy |
| :---: | :---: | :---: | :---: |
| A. Will not actuate or reactuate at desired pressure. | 1. Catalog or nameplate for range of switch. <br> 2. Actuation point with accurate gauge. <br> 3. Maximum surge pressure in system. <br> 4. Maximum current and voltage through switch. <br> 5. Switch element. <br> 6. Loose parts. <br> 7. Switch element position. | 1 a. Setting out of switch range. <br> 1 b . Switch not set at proper pressure. <br> 2. Pressure gauge defective. <br> 3. Surge pressures in system exceed proof pressure of switch. <br> 4. Current or voltage beyond switch capacity. <br> 5. Defective switch element. <br> 6. Vibration or poor assembly. <br> 7. Switch element not properly positioned on mounting. | 1 a. Replace pressure plates and spacer with proper range. <br> 1 b. Readjust switch. <br> 2. Replace pressure gauge. <br> 3. Replace with piston or bourdon tube switch. <br> 4. Install relay or switch element with higher rating. <br> 5. Replace switch element. <br> 6. Replace or tighten. <br> 7. Follow procedure below: <br> (a) Loosen limit switch screws. <br> (b) Pressurize switch to a minimum of $10 \%$ above the top of adjustable range. <br> (c) With a bug lite or continuity meter adjust limit switch position until it is actuated and then move slightly (.005") toward plunger to insure safety factor. <br> (d) Tighten limit switch screws firmly (10-15" / \# torque). <br> NOTE: On HI-P only, there should be $.013 \pm .003$ clearance between Hex nut on plunger and face of fitting when maximum pressure applied. Adjust if necessary. |
| B. Rapidly actuates and reactuates (chatters); or unwanted actuations. | 1. Rapid pressure fluctuations in system. <br> 2. Mechanical vibration of switch. | 1. Surges are in excess of actuation value of switch. <br> 2. Vibration causes unwanted actuation when switch is near set point. | 1 a. Put surge damper on switch. <br> 1 b. Replace with switch element or pressure switch of larger actuation value. <br> 2. Change position of switch or shock mount. |
| C. Actuation point changes with ambient temperature change. | 1. Maximum and minimum temperatures. | 1. Temperature changes drastic (i.e. over plus or minus $50^{\circ} \mathrm{F}$ ). | 1 a. Readjust for changes. <br> 1 b . Set switch at nominal temperature to minimize effect of changes. <br> 1 c. Relocate switch. |
| D. Actuation point of switch changes over period of time. | 1. Maximum current through switch. <br> 2. Number of pressure cycles on switch. <br> 3. Moisture in switch. | 1. Overloading of switch contacts. <br> 2. Service life of switch exceeded (consult data). <br> 3. Corrosion of parts. | 1. Replace with pressure switch with higher current rating or relay. <br> 2. Replace pressure switch. <br> 3. Seal conduit. |
| E. Cannot get current through switch when actuates or reactuates. | 1. Power at switch. <br> 2. Poor electrical connections. <br> 3. Desired electrical circuit. <br> 4. Maximum current through switch. | 1. Line not "hot." <br> 2. Corroded or loose connections. <br> 3. Connected to wrong leads on switch. <br> 4. Contacts fused. | 1. Get power to switch. <br> 2. Make new or tight connection. <br> 3. Make proper connection (consult wiring diagram or color code). <br> 4. Replace switch element. |

## MAINTENANCE

1. Remove cover and visually inspect for evidence of shorting or leakage every million cycles or 6 months, whichever is less.
2. When switch used as safety device, setting should be tested periodically.
3. Disassemble and inspect fitting assembly and replace O-Ring once per year or every 2,000,000 cycles, whichever occurs first.

WARNING: Field repair of UL, CSA and other listed units may void the UL or CSA listing of the repaired unit.

[^0]:    "Auto" position pressure switch controls motor.
    "Hand" position bypasses pressure switch and motor runs continuously. "Off" position motor cannot run.

[^1]:    SS represents Stainless Steel diaphragm
